A selection of multimedia editing software

Video editing is what turns raw material into a full-fledged work. In this article we will tell you about how and with what you can do the installation, its history and terminology.

Hard Cut (or butt gluing) is the simplest and most popular way when one frame is immediately replaced by another. It is used when you need to change the image without transitions or when a new episode begins. Its main disadvantage is the lack of visual information.

Jump Cut (or jump) is a montage technique that allows the film to make a sharp jump in time. It is often used in the editing of interviews.

L and J are transitions. In the first case, the frame is replaced with a new one, but the sound still remains. This allows you not to disrupt the sequence of events, while providing viewers with the necessary information. In the second case, the viewer hears the sound even before the frame appears.

Transition during the action. This technique is often used when editing action scenes. One frame is replaced by another, but the action itself does not stop.

Interruptions help to divert the narrative from the main plot or character. They are used mostly to inform the audience about what is happening outside the environment of the main characters.

An influx is an editing technique by which one frame gradually turns into another. Its length is usually a few seconds.

Darkening is when one frame gradually disappears into a black (often) background, and the second one comes out of it. Usually this technique demonstrates a large gap in time or space between these scenes.

Combination. This transition combines two opposites without destroying the integrity of the plot. An excellent example of a combination is a scene from the "Space Odyssey", in which Kubrick combined the ancient history of the earth with a spaceship.
